Case Study

AppGuard

With the increasing number of Cyber Extortion, Ransomware and Malware attacks, standard anti-virus and other infrastructure security products may not be enough to defend and defeat these sophisticated attacks.

Being acutely aware of the changing nature of cyber attacks and the potential impact on their business and reputation, an established legal organisation approached CSA to find an appropriate solution. The organisation needed assurance that sensitive client and business data had the best cyber protection, which is why AppGuard was a prime choice as the core protection service for its servers and endpoints.

The main benefit for selecting AppGuard for the legal organisation, instead of traditional cyber security solutions that rely on a detect and response system, was that AppGuard's primary function is to prevent all attacks from gaining a presence on a computer in the first place. It will block in real-time against everything malicious: zero-day, memory scraping, code injection, weaponised documents and much more. This type of protection was a core requirement for the organisation.

Since AppGuard is delivered as a service and not a product, CSA acts as the Managed Security Support Provider for the client, providing a 24/7 support service. Our service includes a carefully coordinated onboarding process to identify the legal and business applications that need protection whilst also identifying any services and applications to be blocked. Once in full protection mode, CSA continues to provide a service that facilitates timely policy changes to maintain the highest level of protection for every device.
